

Matrix IR

Matrix IR is new and effective non-invasive skin rejuvenation treatment for static wrinkles, enlarged pores, and acne scars. It delivers two kinds of energy into the skin: radio frequency (RF) energy and energy from a non-invasive laser. This combination of energies penetrates deeply into the skin, and elicits a powerful stimulation of collagen production from the skin's collagen producing cells. The new collagen acts as a natural filler for wrinkles and lines, smoothing the skin contour of areas that are prone to the development of such problems, such as the forehead, around and under the eyes, along the laugh lines, and over the neck. When used for the treatment of enlarged pores (usually seen over the cheeks and nose), the plumping effect of the new collagen on the skin results in shrinkage and refinement of the skin pores. This newly produced collagen also fills depressed acne scars, improving the uneven contour of scarred skin.

The treatment is carried out under topical anesthesia with a numbing cream. There is a mild pin prick sensation during treatment that is quite bearable. Mild redness may occur after the treatment. This fades within a few hours. Matrix IR is a non-invasive procedure with no downtime.

A typical treatment program comprises three matrix IR treatments done once a month, after which maintenance treatments are undergone every six months to maintain the results.
